March 30, 2026

Overview

Scenario: Purple (P) and Green (G) are two countries competing in an arms race.

Research Question: What happens to the long-term spending of each country?

Key Factors:

- More inclined to increase defence spending as the other's rises
- Less inclined to increase spending as its own spending rises
- How does public sentiment affect defence spending?
- How does limiting spending affect a country's position?

Motivation: It helps predict military escalation between countries, which can inform policies to promote peace and prevent conflict.

Base Model

Model Equations

The equations for the base model are:

$$\begin{aligned}\frac{\partial p}{\partial t} &= ag(t) - bp(t) + r \\ \frac{\partial g}{\partial t} &= cp(t) - dg(t) + s\end{aligned}$$

- Feasibility Condition: $(p(t), g(t) \geq 0)$
- a, c : Mutual Fear ($a, c > 0$)
- b, d : Expenditure ($b, d > 0$)
- $(r, s) > 0$ for trust and $(r, s) < 0$ for hostility

Long Term Behavior (Base Model)

First Look at countries that are neutral, $r=s=0$

$$bd > ac$$

$$a=0.1, b=0.7, c=0.2, d=0.1$$

Complete mutual
disarmament

$$bd = ac$$

$$a=0.7, b=0.5, c=0.5, d=0.7$$

Stabilized spending

$$bd < ac$$

$$a=0.5, b=0.5, c=0.2, d=0.1$$

Perpetual arms race

Long Term Behavior (Public Sentiment)

$bd > ac$ or $bd = ac, r < 0, s < 0$

Complete mutual disarmament

$bd = ac, r < 0, s > 0$

One nation grows, other nation shrinks

$bd < ac$ or $bd = ac, r \geq 0, s > 0$

Perpetual arms race

$bd = ac, r = 0, s = 0$

Nations never reach equilibrium

Long Term Behavior (Public Sentiment)

$$bd < ac, r < 0, s < 0$$

$$a=c=0.25, b=d=0.1, r=s=-0.1$$

Arms Equilibrium
determined by initial
spending

$$bd = ac, r < 0, s > 0$$

$$a=b=c=d=0.25, r=-0.3, s=0.3$$

Stable Arms spending

$$bd > ac, r > 0, s > 0$$

$$a=c=0.1, b=d=0.25, r=s=0.3$$

Stable Arms spending

Mutual Logistic Fear

Limitation of the Current Model: Each country has a limited amount of resources at a given time.

Solution: Introduce logistic growth.

Model Equations

The equations after adding logistic growth to account of limited resources are:

$$\begin{aligned}\frac{\partial p}{\partial t} &= a\left(1 - \frac{p(t)}{K_p}\right)g(t) - bp(t) + r \\ \frac{\partial g}{\partial t} &= c\left(1 - \frac{g(t)}{K_g}\right)p(t) - dg(t) + s\end{aligned}$$

Long Term Behavior (Mutual Logistic Fear)

$$bd > ac$$

$$a=0.1, b=0.7, c=0.2, d=0.1, K_p=5, K_g=5$$

Complete mutual
disarmament

$$bd = ac$$

$$a=0.5, b=0.5, c=0.2, d=0.1, K_p=5, K_g=5$$

Stabilized spending

$$bd < ac$$

$$a=0.7, b=0.5, c=0.5, d=0.7, K_p=5, K_g=5$$

Perpetual arms race

Thank you for listening!
